

Voni Demo Call: Prospect Capture

Conversation spec, revision 2 · status: needs-triage · 25 Sep 2026 · source: `.scratch/demo-prospect-capture/spec.md`

What changed since revision 1

- **Work-email gate** is gentler: "We only work with verified businesses. Reach the team at hi@voni.cc."
- **Consent** moved from the invite to after the reveal, when they're enjoying it.
- **Beats are mini-goals with stakes:** nudge → warning → polite end.
- **Hold (new):** leaving the tab to send the email pauses the call, and Voni reads their website while they're away. Works on phones and desktop.
- **Talk clock** pauses on mute and hold. A hard 12-min wall-clock cap protects credits.
- **Reveal** is expanded: Voni explains the whole call was a fun capture and asks how efficient it felt.
- **Jev** matches the email, flags spoofing, and scores off-track behavior.
- ~~Browser callback~~ and ~~Web Push~~ are dropped: keep them in the call.

Voni stops role-playing a made-up business and talks as itself. The visitor emails Voni. Voni finds the email in a busy shared inbox, replies with a code, and the visitor reads the code back. Along the way Voni gets their name and a **verified work email**, reads their website, and brainstorms about their business. The visitor experiences all of this as a live product test. At the end, Voni reveals the whole call was a capture, and that reveal is the proof of the product.

Success rule: the moment the visitor feels they are being captured, we have failed.

1. The talk clock

0–2 min · base	to ~4 min · provisional claimed a business address	to 7 min · verified code check passed
----------------	---	--

- The clock **pauses** on mute and on hold. After ~20s muted, Voni checks in once. Hold is capped at ~2 min.
- A **hard wall-clock cap of ~12 min** (mute and hold included) protects credits.
- If the email never arrives: keep talking business until the provisional limit, then "I'll reply the moment it lands." The reply still goes out.

2. Stakes: every beat is a mini-goal

A visitor who stalls or plays around goes up a ladder. Jev scores off-track behavior on every turn.

1. **Nudge:** "Let's keep it moving, try sending me that email."
2. **Warning:** "Heads up: we've only got a couple of minutes, and I take this seriously. If we can't move forward, I'll have to end the call."
3. **Polite end:** "I'll let you go for now. If you'd like to try it properly, the team's at hi@voni.cc."

3. The conversation, beat by beat

Beat 1 · Open

GOAL: BUY-IN

VONI Hi, I'm Voni. I know you're here to see how useful this would be for your business. I'd rather show you than tell you. Sound good?

VISITOR Sure.

Beat 2 · Invite the test

GOAL: THEY SEND AN EMAIL

VONI Let's try something real. Send me an email from your work address, anything you like, and watch how fast I handle it. The address is on your screen.

Screen: the address appears as a tap-to-copy chip (mailto link on phones). Voni says it once. No consent ask here.

Beat 3 · Hold (automatic)

GOAL: NOTHING BREAKS WHILE THEY'RE AWAY

VONI Go ahead, I'll hold.

The visitor opens Mail or switches tab, and the page is hidden. The mic and talk clock pause. Behind the scenes, Jev spots the newest plausible sender in the inbox, and Voni pre-reads that domain's website. If the phone dropped the connection, the call reconnects on return with the conversation context intact.

Beat 4 · The claim

GOAL: VERIFIED IDENTITY (EMAIL, NAME)

VONI Welcome back! I'm getting lots of emails right now, from you and others testing me. To keep everyone's data safe, which address did you use?

VISITOR andres@acme-realty.com

VONI Andres! I've already been through acme-realty.com while you were away. Rentals and sales around the marina, right?

Business domain → provisional extension. If the pre-read didn't match: "Give me a second, I'm looking at your site now..." If the address shows no name (info@), Voni asks for it lightly later.

Gmail branch: "Do you have a work email? We only work with verified businesses." → none → "No problem. Reach the team at hi@voni.cc and we'll gladly look into it." → polite end.

Beat 5 · Business talk (the wait, used)

GOAL: BUSINESS PROFILE

VONI I'm still going through your listings pages... How are leads reaching you today? Have you tried anything like me before?

Voni asks what they do, whether they've used this kind of tech, and where it could help, then brainstorms concrete ideas for their business. The work email is what justifies the extra time.

Beat 6 · Reply + code check

GOAL: PROVE INBOX OWNERSHIP

VONI Found your email. Writing you back... sending... just sent. I put a little code in there to test things out. What does it say?

VISITOR 4-8-2-1.

The reply contains their name, the 4-digit code, and a short warm line. It looks nothing like a security email. The visitor gets two tries. Voni never says "sent" before the send actually succeeds.

Beat 7 · The reveal (the wow)

GOAL: THEY FEEL THE PRODUCT

VONI Perfect. Fun fact: that was an OTP, a real security check. Didn't feel like one, right? And honestly, this whole call was me learning who you are: your name, a verified email, what Acme does. Not a single form. There are plenty more creative ways to do this with *your* customers. How efficient did that feel to you?

Verified extension → 7 min. Open question, and Voni lets them react.

Beat 8 · Consent + close

GOAL: PERMISSION + INTENT

VONI Glad you liked it. Mind if the team follows up at andres@acme-realty.com?

VISITOR Sure.

VONI I've passed my notes on. Anything you'd like them to prepare for you?

A "no" to follow-up marks the Prospect no-marketing. The answer to the last question is the strongest intent signal of the call.

4. Agent rules

- Never announce data collection before the reveal. Every ask is a step in a test.
- Stay reactive ("writing... sending... sent", "reading your site...") but never ahead of reality.
- Speak and write the reply in the picked language. The team summary is English.
- v1 never asks for phone or WhatsApp.

5. Jev's three jobs

Job	Input	Drives
Match the email to the caller	Claimed address (with speech-to-text near-misses), inbox senders, timing	Pre-read during hold; reply target
Spoof / spam flag	The matched email	Whether Voni replies
Off-track score	Each visitor turn vs. the current beat's goal	The stakes ladder

Free vs. business email is a plain domain list: instant, no model needed.

6. What the team gets (Prospect record)

Name · claimed email · verified flag · domain · website summary · what they do · prior tech use · ideas brainstormed · intent answer · consent / no-marketing · language · off-track warnings · transcript · AI summary. Shown on an admin page gated by `VONI_ADMIN_EMAILS`. The visitor never sees it.

7. Worth watching

Mobile hold is the riskiest piece. iOS Safari can drop audio and the socket as soon as the visitor switches to Mail. The reconnect-with-context path has to feel seamless, so test it on a real iPhone early (`npm run dev:phone`, over https).

Gate drop-off. Track how many visitors end at the work-email gate. If many are real small businesses on gmail, "gmail + a real website" is the fallback lever.

8. What it takes to build (not chosen yet)

Today	Needed
Demo agent has no tools (<code>stored-agents.ts</code>)	Tools: match inbox · send reply with code · check code · read website · extend · end call
120s cap baked into the token (<code>api/demo/token</code>)	Mint the token with ~12 min; enforce the talk clock ourselves
Timer counts from <code>startedAt</code> ; mute doesn't pause it	Talk clock that pauses on mute and hold
No page-visibility handling	Hold on <code>visibilitychange</code> + reconnect with carried context
No email send or read (Gmail tools are stubs)	Gmail API read + send for the test inbox
Jev judges voice turns only (<code>jev-judges.ts</code>)	Three new judge prompts (match, spoof, off-track)
<code>leads</code> needs an org + phone	New <code>prospects</code> table + admin page + summary
Call card is transcript-only (DESIGN.md §10c)	Address copy chip; amend the rule

9. Dropped / deferred

- **Browser callback and Web Push:** dropped. A callback risks losing the prospect, so we keep them in the call.
- **Phone / WhatsApp tests:** v2 ("WhatsApp me", visitor-initiated).
- **test@voni.cc** via Cloudflare Email Routing: once the domain is registered. Until then: nedalk.js@gmail.com (the shared-inbox noise is wanted).
