

Voni Demo Call: Prospect Capture

Conversation spec · status: needs-triage · 25 Sep 2026 · source: `.scratch/demo-prospect-capture/spec.md`

Voni stops role-playing a made-up business and talks as itself. The visitor emails Voni, Voni finds the email, replies with a code, and the visitor reads the code back. Along the way Voni learns their name, gets a **verified work email**, reads their website, and talks through their business. The visitor experiences all of this as a live product test. Only at the end does Voni reveal that the "code" was a security check. That reveal is the proof of the product.

Success rule: the moment the visitor feels they are being captured, we have failed.

1. The clock (scarcity)

0–2 min · base call	to ~4 min · provisional claimed a business address	to 7 min · verified code check passed
---------------------	---	--

- Free email (gmail, outlook...) → **work-email gate**: one re-prompt, then a polite hang-up.
- Refuses to send any email → same treatment: one re-prompt, then a polite hang-up.
- Email late at the provisional limit → "I'll reply the moment it lands," then a polite close. The reply still goes out.

2. The conversation, beat by beat

Beat 1 · Open

VONI Hi, I'm Voni. I know you're here to see how useful this would be for your business. I'd rather show you than tell you. Sound good?

VISITOR Sure.

Beat 2 · Invite the test (+ consent)

VONI Let's try something real. Send me an email, anything, and watch how fast I handle it. The address is on your screen. And the Voni team may follow up there too, OK?

Screen: the inbox address appears as a tap-to-copy chip (a mailto link on phones). Voni says the address only once. A "no" to follow-ups still gets the demo, but the Prospect is marked no-marketing.

Beat 3 · The claim (capture #1: email, name)

VISITOR OK, sent.

VONI I'm getting lots of emails right now, from you and other people testing me. To keep everyone's data safe, which address did you send it from?

VISITOR andres@acme-realty.com

VONI Andres, nice to meet you.

Business domain → provisional extension. If the address shows no name (info@, sales@), Voni asks for it lightly later: "I start every email with a name, what's yours?"

Gmail branch: "Sorry, this demo is for businesses only. Got a work email?" → one more try → "I'll let you go, come back when you want to try it for real." → hangs up.

Beat 4 · Research + business talk (capture #2: business profile)

VONI While that comes in, I'm looking at acme-realty.com right now... so you handle rentals and sales around the marina. How are leads reaching you today?

Voni asks what they do, whether they've tried voice AI before, and where it could help, then brainstorms concrete ideas for their business. This also covers a slow email.

Beat 5 · Reply + code check (verification)

VONI Found it, got your email. Writing you back... sending... just sent. I put a little code in there to test things out. Tell me what it says?

VISITOR Uh... 4-8-2-1.

The reply email contains: their name, the 4-digit code, and a short warm line Voni writes itself. Nothing in it looks like a security email. The visitor gets two tries. Narration always matches the real tool state: Voni never says "sent" before the send succeeds.

Beat 6 · The reveal (the wow)

VONI Perfect. Fun fact: that was an OTP, a real security check, and I just verified you own that inbox. Didn't feel like one, right? How was that?

Verified extension → 7 minutes total. It's an open question, so Voni lets them react. This is the product proof: verification disguised as conversation.

Beat 7 · Close (capture #3: intent)

VONI I've passed my notes to the team; they'll follow up by email. Anything you'd like them to prepare for you?

Their answer is the strongest intent signal of the call, and it's saved on the Prospect.

3. Agent rules

- Never announce data collection. Every ask is a step in a test that benefits the visitor.
- Stay reactive: narrate what's happening ("writing... sending... sent") so nothing feels laggy, but never ahead of reality.
- A claimed address that never sends mail means the call ends at the provisional limit and the code check can't pass.
- Speak and write the reply in the language the visitor picked. The team summary is always in English.
- v1 never asks for a phone number or WhatsApp.

4. What the team gets (Prospect record)

Name · claimed email · verified flag · domain · website summary · what they do · prior tech use · ideas brainstormed · intent answer · consent / no-marketing · language · transcript · AI session summary. Shown on an admin page gated by `VONI_ADMIN_EMAILS`. The visitor never sees the summary.

5. Decisions made in this session

#	Decision	Choice
1	Demo payoff	Gather Prospect info; team-side session summary
2	Asks	Name + email first; other channels later, as live tests

3	Consent	One casual line at the email ask
4	Term	Prospect (not Lead)
5	Summary audience	Team only
6	Free email	Hard gate: one re-prompt, then a polite hang-up
7	Matching the email	Shared inbox + "which address did you use?"
8	Persona tabs	Replaced; Voni as itself; no role-play
9	Showing the address	On-screen tap-to-copy chip
10	Clock	2 → ~4 (claim) → 7 min (verified)
11	Verification	Always a 4-digit code in the reply; the reply = name + code + warm line
12	Reveal	"That was an OTP, didn't feel like one, right?"
13	Language	Keep the picker; team summary in English
14	Team view	prospects table + admin page
15	Close	Intent question
16	Phone / WhatsApp	Deferred to v2 ("WhatsApp me", visitor-initiated)
17	Test inbox	nedalk.js@gmail.com via the Gmail API

6. Things to reconsider (my suggestions)

Hard gate vs. your proof vertical. Many independent property agents, restaurants, and dealers run their business on gmail. The hard gate turns them away. Cheap middle ground if you see drop-off: accept gmail + a business website that resolves. Watch gate hang-ups in the Prospect data before changing anything.

Personal inbox access. Using nedalk.js@gmail.com gives the server read and send access to that whole inbox, and the demo traffic mixes with your mail. A fresh dedicated Gmail costs 5 minutes. Move to `test@voni.cc` (Cloudflare Email Routing) once the domain is registered; it doesn't resolve today.

Timing is tight. Greeting + ask (~30s), then typing (~45s), then delivery (5–30s), then the reply lands in their inbox (5–30s). The provisional extension covers it, but test on real mail providers early. Outlook/corporate filters can delay mail by a minute or more.

7. What it takes to build (not chosen yet)

Today	Needed
Demo agent has no tools (<code>stored-agents.ts</code>)	Tools: find email by sender · send reply with code · check code · read website · extend session · end call
120s cap baked into the token (<code>api/demo/token</code>)	Mint the token with a 7-min cap; enforce 2 → 4 → 7 ourselves
No email send or read (Gmail tools are stubs)	Gmail API read + send for the test inbox

leads needs an org + phone, has no email	New prospects table + admin page + end-of-call summary
Call card is transcript-only (DESIGN.md §10c)	Address copy chip; amend the rule
No free-email detection	A free-email domain list
